EDUCATION

Michigan Technological University | Houghton, MI
BS Computer Science

Expected Graduation: Spring 2026
Cumulative GPA: 4.00

PROFESSIONAL EXPERIENCE

Product Development and Research Intern | Phase 1 Engineering

April 2024 - Aug 2024

Project: Home Radar Tracking Development & Analysis

- Performed market analysis on existing technologies to discover methods of solving customer requirements.
- Designed and performed rigorous tests to ensure customer design requirements were met.
- Manipulated data processing algorithms to solve situational problems, enhancing data accuracy and reliability.

Project: Simulation Enhancement Tools

- Created internal tools using Python to extend the capabilities of simulation software related to EMF design saving customers thousands of dollars.
- Developed tools for visualization and manipulation of simulation data accelerating development of new technologies.
- Developed backend in C improving speed and efficiency up to 3x improving user experience and accelerating design process.

Project: RFID System Initial Analysis

- Researched ISO standards to determine the functioning requirements and data exchange process.
- Developed a system establishing communication with a RFID chip under conditions similar to actual product needs.

Product Development and Research Intern | Phase 1 Engineering

June 2023 – Aug 2023

Project: Reduced Cost Haptic Device

- Collaborated with senior team members to reverse engineer market solution.
- Designed circuitry to significantly reduce costs by removing the need for an amplifier allowing direct control by MCU.
- Mathematically optimized solution to meet situational requirements and improve efficiency.
- Created prototypes of new products using 3d printing and simulation.

Engineering Lab Assistant | Phase 1 Engineering

Feb 2023 – June 2023

- Performed research on legal regulations for Radio devices at specific frequencies.
- Created and performed complex electromagnetic simulations.
- Performed exploratory research for senior engineers on new and developing projects.

ENTERPRISE

Team Lead | Innovative Global Solutions Infant Incubator

January 2025 – Present

The technical lead for the Infant Incubator humanitarian project on Innovative Global Solutions designing a low-cost, low-power incubator for use in underdeveloped regions of the world.

- Established documentation requirements for incubator prototype and subsystems enabling future success.
- Collaborated with sponsor to receive design and engineering feedback improving design outcomes.
- Facilitated cross team collaboration and communication through weekly meetings.
- Mentor and guide younger members on relevant technologies and design principles.

Controls Team | Innovative Global Solutions Infant Incubator

Sept. 2023 – Present

Worked alongside the controls subteam on the Infant Incubator project developing embedded code in C++ as well as the electromechanical systems controlling the incubator and the user interface.

- Refactored and expanded code to follow an object oriented paradigm improving functionality and use.
- Managed time multiplexing of the MCU between demanding processes ensuring time dependent components functioned correctly.

RESEARCH

Rules as Code Research Group | Dr. Wallace & Dr. Ebnenasir

Oct. 2024 – Present

Worked with Dr. Wallace in a “Rules as Code” research program built around using computational modelling software to interpret statutory rules.

- Developed SURF proposal for summer work around a model of the statutory rules affecting student registration and graduation requirements.

COMMUNITY INVOLVMENT

- Annual volunteering for First Robotics supporting competition events as a robot inspector.
- Annual volunteering for Little Brothers Friends of the Elderly food drive.
